Next View Software Announces Labor Management System Enhancements

Advanced reporting, charting and dashboard enhancements provide users with powerful, easy to use data analysis and presentation capabilities

Orange, CA – Next View Software, an innovative provider of on-demand Supply Chain Productivity software solutions, announced today that it now offers advanced functionality for reporting, charting and dashboards for their labor management and workforce productivity solution (LMS).

Steve Simmerman, Business Development leader for Next View Software, says, “Next View’s LMS already provides extensive data analysis, charting and reporting capabilities. However, the latest release of the Next View Labor Management System takes these capabilities to the next level. These enhancements allow our users to visualize any query they create within the system. Users can create ad hoc reports and charts much more easily and they can also create their own dashboard preferences that allow them to see the data that is important to them in their day to day role within the organization. Users can freely drag and drop dashboard components and they are automatically resized based on the preferences of the dashboard for that particular user. All of this is done by the end user. There is no need for IT intervention or additional data integration. Feedback from customers and implementation partners has been very positive.”

Bob Rosales, COO of Next View says, “Our reporting, charting and dashboard capabilities are tightly integrated in real-time with our LMS. We didn’t just layer a business intelligence (BI) tool on top of our LMS. We wanted to eliminate the need for more data integration and summarization. For example, we allow users to create their own dashboard components, including complex charts that are the result of combining multiple charts and further allow our users to drill down from the chart itself all the way down to the supporting data elements in real-time. The use of a smart ‘tool tip’ enables our customers to see the supporting data for various data points on the charts they create without having to leave the dashboard. The ability to overlay bar charts with line charts, for example, allows our LMS customers to identify trends and react much more quickly. These enhancements are all about empowering our users with very flexible and powerful data analysis and presentation tools so they can maximize the value from our LMS.”

Multiple chart composition

Simmerman adds, “We will continue to provide leading edge enhancements to our LMS customers. Our customers invest their time, money and energy implementing an LMS solution and our data analysis and presentation capabilities are designed to make it easier for them to continually analyze and improve their operations over time. It’s all about value to our customers at the most competitive total cost of ownership possible. We are driven to continue to deliver leading edge functional and technical solutions to our customers.”
